AB The present invention relates to means for the detection and characterization of nucleic acid sequences, as well as variations in nucleic acid sequences, by an Invader.RTM. oligonucleotide-directed cleavage detection assay. The present invention also relates to methods for forming a nucleic acid cleavage structure on a target sequence and cleaving the nucleic acid cleavage structure in a site-specific manner. The structure-specific nuclease activity of a variety of enzymes is used to cleave the target-dependent cleavage structure, thereby indicating the presence of specific nucleic acid sequences or specific variations thereof. Derivs. of thermostable **DNA polymerases** and their **mutants** that retain their 5'-nuclease activity but lack polymerase activity are described for use in the nucleic acid detection system. The nuclease activity cleaves the single-stranded moiety of a Y-shaped structure and so is of use in selected cleavage of reporter

sequences in a hybridization assay that includes 5'-nuclease-dependent cleavage and amplification steps. The present invention further relates to methods and devices for the sepn. of nucleic acid mols. based on charge. The present invention also provides methods for the detection of non-target cleavage products via the formation of a complete and activated protein binding region. The invention further provides sensitive and specific methods for the detection of human cytomegalovirus nucleic acid in a sample.

AB The invention provides **mutant**, chimeric thermostable **DNA polymerase** enzymes consisting of an N-terminal region derived from the 5'-nuclease domain of a Thermus species **DNA polymerase** and a C-terminal region derived from the 3' to 5' exonuclease and polymerase domains of Tma **DNA polymerase**. These **mutant** chimeric thermostable **DNA polymerase** enzymes have improved properties in nucleic acid sequencing reactions. Also provided are nucleic acids encoding said **mutant** chimeric thermostable **DNA polymerase** enzymes, vectors comprising said nucleic acids and host cells transformed with said vectors. Also provided are compns. comprising said mutated, chimeric thermostable **DNA polymerase** enzymes and non-ionic polymeric detergent(s). Furthermore methods for producing the said enzymes and methods and kits for using the said enzymes are provided.

SUMMARY LANGUAGE: English; Russian

AB Arylazides N-(4-azido-2,5-difluoro-3-chloropyridinyl-6)-beta-alanine (Ia) and N-(4-azido-2,5-difluoro-3-chloropyridinyl-6)-glycine (Ib) were synthesized and covalently attached to 5-(3-aminopropenyl-1)-dUTP through the amino group to give 5'-triphosphate (IIa) and 5'-triphosphate (IIb). The resulting azides were subjected to photolysis in aqueous solution. The spectral and photochemical characteristics of azides (I) and (II) imply that their use for the modification of biopolymers holds promise. Compounds (IIa, b) effectively substituted dTTP in DNA polymerization catalyzed by thermostable **DNA polymerase** from **Thermus thermophilus** B-35 (Tte **DNA polymerase**). Photoaffinity modification of Tte **DNA polymerase** was carried out by dTTP analogues (IIa, b) and by earlier obtained 5-(N-(5-azido-2-nitrobenzoyl)-trans-3-aminopropenyl-1) deoxyuridine 5'-triphosphate (III) and 5-(N-(4-azido-2,3,5,6-tetrafluorobenzoyl)-trans-3-aminopropenyl-1) deoxyuridine 5'-triphosphate (IV) using two **variants** of labeling. All four dTTP analogues were shown to modify Tte **DNA polymerase**.

AB The present invention relates to means for the detection and characterization of nucleic acid sequences, as well as variations in nucleic acid sequences. The present invention also relates to improved

cleavage means for the detection and characterization of nucleic acid sequences. Structure-specific nucleases derived from a variety of thermostable organisms are provided. These structure-specific nucleases are used to cleave target-dependent cleavage structures, thereby indicating the presence of specific nucleic acid sequences or specific variations thereof. Disclosed are methods for the detection and characterization of nucleic acid sequences and their **variants** by using structure-specific 5'-nucleases derived from thermostable **DNA polymerases**, or the FEN-1, RAD2, or XPG class of nucleases. The enzyme cleaves the target nucleic acid sequence at a structure formed via annealing with 2 pilot oligonucleotide sequences. Also disclosed are methods and devices for the sepn. of nucleic acid mols. based on charge. Also disclosed are methods for the detection of non-target cleavage products via the formation of a complete and activated protein binding region. Isolation of genes for endonuclease FEN-1 from Pyrococcus woesei, Methanococcus jannaschii, Archaeoglobus fulgidus, Methanobacterium thermoautotrophicum, and Pyrococcus furiosus are described. Prepn. of 5'-nucleases by deleting the C-terminal polymerase domain or by point mutations of Taq **DNA polymerase**, and the prepn. of chimeric enzymes of the FEN-1 endonucleases are also shown. The cleavage method was used for the identification of hepatitis C virus and human ras gene.

ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS

AB Histidyl-tRNA synthetase (HisRS) differs from other class II aminoacyl-tRNA synthetases (aaRS) in that it harbors an arginine at a position where the others bind a catalytic Mg2+ ion. In computer experiments, four **mutants** of HisRS from Escherichia coli were engineered by removing the arginine and introducing a Mg2+ ion and residues from seryl-tRNA synthetase (SerRS) that are involved in Mg2+ binding. The **mutants** recreate an active site carboxylate pair conserved in other class II aaRSs, in two possible orders: Glu-Asp or Asp-Glu, replacing Glu-Thr in native HisRS, The **mutants** were simulated by molecular dynamics in complex with histidyl-adenylate. As controls, the native HisRS was simulated in complexes with histidine, histidyl-adenylate, and histidinol. The native structures sampled were in good agreement with experimental structures and biochemical data. The two **mutants** with the Glu-Asp sequence showed significant differences in active site structure and Mg2+ coordination from SerRS. The others were more similar to SerRS, and one of them was analyzed further through simulations in complex with histidine, and His+ATP. The latter complex sampled two Mg2+ positions, depending on the conformation of a loop anchoring the second carboxylate. The lowest energy conformation led to an active site geometry very similar to SerRS, with the principal Mg2+ bridging the alpha- and beta-phosphates, the first carboxylate (Asp) coordinating the ion through a water molecule, and the second (Glu) coordinating it directly. This **mutant** is expected to be catalytically active and suggests a basis for the previously unexplained conservation of the active site Asp-Glu pair in class II aaRSs other than HisRS. Proteins 32:362-380, 1998. (C) 1998 Wiley-Liss, Inc.

AB Derivs. of thermostable **DNA polymerases** that retain their 5'-nuclease activity but lack polymerase are described for use in a nucleic acid detection system. The nuclease activity cleaves the single-stranded moiety of a Y-shaped structure and so is of use in selected cleavage of reporter sequences in a hybridization assay that includes two 5'-nuclease-dependent cleavage and amplification steps. The presence of the target sequence is demonstrated by the release of the reporter moiety from sequences immobilized on a carrier. The ability of the nuclease activity to cleave such structures was shown by the inability of intact Taq polymerase to amplify a hairpin sequence, although the nuclease-free Stoffel fragment could amplify the target sequence. The prepn. and characterization of a no. of polymerase **mutants** for use in these assays is demonstrated. Specific alterations of the Thermus aquaticus Taq gene wee: a deletion between nucleotides 1601 and 2502 (the end of the coding region), a 4-nucleotide insertion at position 2043, and deletions between nucleotides 1614 and 1848 and between nucleotides 875 and 1778. Three of these derived 5'-nucleases were designated Cleavase BX, Cleavase BB, and Cleavase BN.
